

### Functions in C#

# Working Example: Vision

Write a Function named addition that takes two parameters as input and then returns their sum.

### Solution with Functions

```
static int add(int n1, int n2)
{
    return n1 + n2;
}
```

```
static void Main(string[] args)
    int num1;
    int num2;
    Console.Write("Enter 1st Number: ");
    num1 = int.Parse(Console.ReadLine());
    Console.Write("Enter 2nd Number: ");
    num2 = int.Parse(Console.ReadLine());
    int result = add(num1, num2);
    Console.WriteLine("Sum is {0}", result);
    Console.Read();
```

### Solution with Functions

```
static int add(int n1, int n2)
{
    return n1 + n2;
}
```

Everything is same except we have to write static at the start of function definition

```
static void Main(string[] args)
   int num1;
   int num2;
   Console.Write("Enter 1st Number: ");
   num1 = int.Parse(Console.ReadLine());
   Console.Write("Enter 2nd Number: ");
   num2 = int.Parse(Console.ReadLine());
   int result = add(num1, num2);
   Console.WriteLine("Sum is {0}", result);
   Console.Read();
```

### Solution with Functions

```
static int add(int n1, int n2)
{
    return n1 + n2;
}
```

We can write this function even after the main without explicitly giving the function prototype.

```
static void Main(string[] args)
   int num1;
   int num2;
   Console.Write("Enter 1st Number: ");
   num1 = int.Parse(Console.ReadLine());
   Console.Write("Enter 2nd Number: ");
   num2 = int.Parse(Console.ReadLine());
   int result = add(num1, num2);
   Console.WriteLine("Sum is {0}", result);
   Console.Read();
```

# File Handling in C#

## Working Example: Vision

Write a program that reads the data line by line from the file if the file exists.

```
static void Main(string[] args)
    string path = "G:\\OOP 2022\\BootingCSharp\\textfile.txt";
   if (File.Exists(path))
       StreamReader fileVariable = new StreamReader(path);
        string record;
       while ((record = fileVariable.ReadLine()) != null)
            Console.WriteLine(record);
       fileVariable.Close();
   else
       Console.WriteLine("Not Exists");
```

This returns
true if the file
exists otherwise
false

```
static void Main(string[] args)
    string path = "G:\\OOP 2022\\BootingCSharp\\textfile.txt";
    if (File.Exists(path))
       StreamReader fileVariable = new StreamReader(path);
        string record;
       while ((record = fileVariable.ReadLine()) != null)
            Console.WriteLine(record);
       fileVariable.Close();
   else
       Console.WriteLine("Not Exists");
```

```
string path = "G:\\OOP 2022\\BootingCSharp\\textfile.txt";
                      if (File.Exists(path))
                          StreamReader fileVariable = new StreamReader(path);
                          string record;
                         while ((record = fileVariable.ReadLine()) != null)
This Creates
the
                             Console.WriteLine(record);
StreamReader
                         fileVariable.Close();
variable to read
the data from
                      else
the file
                         Console.WriteLine("Not Exists");
```

static void Main(string[] args)

```
string path = "G:\\OOP 2022\\BootingCSharp\\textfile.txt";
                      if (File.Exists(path))
                          StreamReader fileVariable = new StreamReader(path);
                          string record;
                          while ((record = fileVariable.ReadLine()) != null)
This Keeps on
                              Console.WriteLine(record);
reading the
data into record
                          fileVariable.Close();
variable until
there is no more
                      else
data in the file
                          Console.WriteLine("Not Exists");
```

static void Main(string[] args)

# Working Example: Vision

Write a program that Appends the data into the file.

```
static void Main(string[] args)
{
    string path = "G:\\OOP 2022\\BootingCSharp\\textfile.txt";
    StreamWriter filevariable = new StreamWriter(path, true);
    filevariable.WriteLine("hello");
    filevariable.Flush();
    filevariable.Close();
}
```

```
static void Main(string[] args)
   string path = "G:\\OOP 2022\\BootingCSharp\\textfile.txt";
   StreamWriter filevariable = new StreamWriter(path, true);
   filevariable.WriteLine("hello");
   filevariable.Flush();
   filevariable.Close();
                                               This Creates
                                               the
                                               StreamWriter
                                               variable to write
                                               the data into
                                               the file
```

```
static void Main(string[] args)
{
    string path = "G:\\00P 2022\\BootingCSharp\\textfile.txt";
    StreamWriter filevariable = new StreamWriter(path, true);
    filevariable.WriteLine("hello");
    filevariable.Flush();
    filevariable.Close();
}
```

This parameters shows that the data will be appended into the file

```
static void Main(string[] args)
{
    string path = "G:\\00P 2022\\BootingCSharp\\textfile.txt";
    StreamWriter filevariable = new StreamWriter(path, true);
    filevariable.WriteLine("hello");
    filevariable.Flush();
    filevariable.Close();
}

Clears all buffers.
```

### Working Example: Vision

Make a SignIn and SignUp Application that will check if the user is stored in the file then it will allow it to LogIn. If the user SignUp then the record is stored in the file in comma separated format.

### Step 1: Make the Menu

#### Step 2: Read the data from the file

```
static void readData(string path, string[] names, string [] password)
     int x = 0:
     if (File.Exists(path))
          StreamReader fileVariable = new StreamReader(path);
          string record;
          while ((record = fileVariable.ReadLine()) != null)
                names[x] = parseData(record, 1);
                password[x] = parseData(record, 2);
               x++;
                if (x >= 5)
                    break:
          fileVariable.Close():
    else
         Console.WriteLine("Not Exists");
```

```
static string parseData(string record, int field)
    int comma = 1;
    string item = "";
    for (int x = 0; x < record. Length; x++)
        if (record[x] == ',')
            comma++;
        else if (comma == field)
            item = item + record[x];
    return item:
```

### Step 3: Make the SignIn Function

```
static void signIn(string n, string p, string[] names, string [] password)
            bool flag = false;
            for (int x = 0; x < 5; x++)
                if (n == names[x] && p == password[x])
                    Console.WriteLine("Valid User");
                    flag = true;
            if (flag == false)
                Console.WriteLine("Invalid User");
            Console.ReadKey();
```

### Step 4: Make the SignUp Function

```
static void signUp(string path, string n, string p)
{
        StreamWriter file = new StreamWriter(path, true);
        file.WriteLine(n + "," + p);
        file.Flush();
        file.Close();
}
```

### Step 5: main

```
static void Main(string[] args)
    string path = "G:\\OOP 2022\\BootingCSharp\\textfile.txt";
    string[] names = new string[5];
    string[] password = new string[5];
    int option;
    do
         readData(path, names, password);
         Console.Clear();
         option = menu();
         Console.Clear();
         if (option == 1)
             Console.WriteLine("Enter Name: ");
             string n = Console.ReadLine();
             Console.WriteLine("Enter Password: ");
             string p = Console.ReadLine();
             signIn(n, p, names, password);
          else if (option == 2)
             Console.WriteLine("Enter New Name: ");
             string n = Console.ReadLine();
             Console.WriteLine("Enter New Password: ");
             string p = Console.ReadLine();
             signUp(path, n, p);
     while (option < 3);</pre>
     Console.Read();
```

# Learning Objective

Write C# programs that stores data permanently in files.

#### Self Assessment

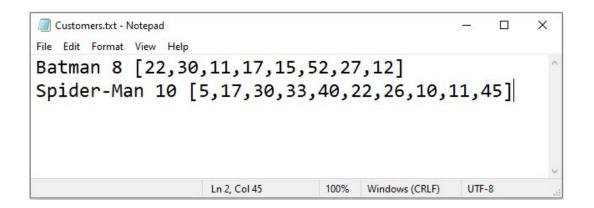

1. KamyabLife is launching a network of autonomous pizza delivery drones and wants you to create a flexible rewards system (Pizza Points) that can be tweaked in the future. The rules are simple:

if a customer has made at least N orders of at least Y price, they get a FREE pizza!

The information of the customers is stored in a file Customers.txt in the following format. First the name of the customer is given then after the space the number of orders are given then after the space within the brackets all the orders prices are given.

#### Self Assessment

Your task is to create a function that takes a minimum number of orders and a minimum order price then display the names of the customers that are eligible for a free pizza.

### Self Assessment

#### Test Cases

Input	Output
pizza_points(5, 20)	"Spider-Man"
pizza_points(3, 10)	"Batman" "Spider-Man"
pizza_points(5, 100)	w//
